CESENA—Futura will showcase its Logika grading range at this year's Fruit Logistica, tailored for a range of demands.

by Carl Collen

Fruit technology and equipment specialist Futura will present its Logika grading line concept to the industry at this year's Fruit Logistica in Berlin. According to the Italian company, the line guarantees reliability, quality and attention to detail expected of a Made in Italy product, and will be presented in two formats in Berlin – Logika Lateral Discharge for reduced production requirements of up to five tonnes per hour, and Logika Central Discharge for higher demands of up to 20 tonnes per hour.

"Simplicity, speed of customisation and adaption to different needs are Logika's jewel in the crown, which

with its modular production system allows us to always create a tailor-made products," said the group's Omar Papi. "Thanks to the different type of transport systems, we can work the more rounded and traditional fruits, such as apples, peaches, apricots and citrus, as well as those of an irregular shape like avocados, mangoes, pomegranates and onions."

Logika selects fruits through parameters such as weight, diameter and colour, with each of these factor applied either individually or in combination. The software has a user-friendly approach, Papi explains, while also including a range of features such as the Futura app, Futura Smart Grading, which allows the company to monitor machines remotely. **E**
